## PALS : Pro Auto Light System light assistant

The PALS light assistant is a comfort CE and E11 certified upgrade function. Your Porsche™'s driving light (low beam) is switched on and off automatically, irrespective of the ambient brightness.

Despite possible support by the PALS assistant, it is the responsibility of the driver to switch on the driving light using the conventional light switch in accordance with the relevant national regulations.

Activating the headlights using the PALS light assistant does not therefore absolve the driver of responsibility for the correct operation of the driving light.

The low beam, instruments and PCM\* night mode are switched on automatically in the following situations:

- Dusk/Darkness/Dawn
- Travelling through tunnels
- High speed driving\*\*.

\*: if PCM Porsche™ Communication Management "night mode" option is activated

\*\* : Note that during daylight, PCM\* will always stay in day mode and instrument lights will always stay off.

### High Speed driving function:

The driving light (low beam) is switched on at speeds of over 50 mph (80 km/h). If you are travelling slower than 38 mph (60 km/h), the driving light is switched off after a delay of approx. 2 minutes, if the external lighting conditions permit.

### Warning notes on operation:

- Always refer to your Porsche™ owner manual for instructions on the Light Switch functions and your car operations.
- Fog or rain are not recognised. In such event, driving light must be switched on manually according to local laws:  
- Risk of accident due to driving without lights. Always carefully monitor the automatic driving light control.
